Questions regarding the San Diego River WQM database or interpretation of results expressed in these appendices can be directed to the attention of the report's author, John C. Kennedy, through contacting SDRPF at info@SanDiegoRiver.org, or the RiverWatch Coordinator at 619-297-7380.

SDRPF - RiverWatch i December 2011

Appendix E - San Diego RiverWatch WQ Monitoring Program

Appendix E provides an overview of SDRPF's RiverWatch water quality monitoring (WQM) program that, over the past 9 years, has been continuously engaged in collecting and evaluating data pertaining to the Lower San Diego River (LSDR) watershed on a monthly basis.

Monitoring Period & Coverage: Monthly monitoring over past 9 years (Oct. 2004 – Nov. 2013) covering the Lower San Diego River and its tributaries extending downstream from Lakeside (river mile 19.8 elev. 340 ft amsl) to the Estuary (river mile 2.96, elev. 4.8 ft amsl) between the I-5/Pacific Hwy. overpasses. The LSDR watershed and monitoring sites are shown on **Figure E.1.**

Monitoring Sites: 15 total - 12 on main course (Mission Valley Section - sites 1-7, Mission Gorge Section - sites 8-10, Santee Basin Section - sites 11-15) plus three tributary stream sites are listed in **Table E.1.** Site locations, river milage, bed elevations and coordinates are provided in **Table E.2.**

Table E.1 LSDR Sections, Reaches and Monitoring Sites

Section	/Reach/Tributary	Site #	Comments
	Estuary Entrance	1E/1W	Tidal Influence at transition from river to SDR Estuary
Lo	wer Mission Valley (LMV)	2E/W, 3 & 4	4 miles of lower river extending to I-805
Up	pper Mission Valley (UMV)	5,6 & 7	4-mile stretch from I-805 to Princes View Dr
Mission Valley ((West Sites)	1-7	8-mile western portion through Mission Valley
Mid-Section	Mission Gorge (MG)	8,9 & 10	5-mile mid-section, Princess View Dr to Kumeyaay Lk
	Lower Santee Basin (LSB)	11,12&15	2-mile stretch from Kumeyaay Lk to Carlton Hills Blvd
	Upper Santee Basin (USB)	13 & 14	3-mile stretch from Carlton Hills Blvd to Riverford Rd
Santee Basin (SI	3)	11-15	5-mile eastern section from Kumeyaay Lk to Lakeside
Eastern Portions	s (East Sites)	8 -15	10-mile eastern/upper 3 reaches (2 sections)
Tributaries:			
Mı	urphy Canyon/Qualcom a)	5a	Enters LSDR southwest of Qualcom Stadium
Jackso	on Dr/Birchcreek Outfall b)	9	Enters LSDR at Sycott Wash (d/s of Site 8)
Santee Lakes	s/E. Sycamore Cnyn Creek	12	Enters LSDR d/s of Carlton Oaks GC (u/s of Site 11)
	Forester Creek c)	15	Enters LSDR at Carlton Oaks GC (u/s of Site 12)
Lower SDR Wat	tershed (LSDR)	1-15	Weighted average of all 5 reaches or all 3 sections

⁽a) Monthly monitoring discontinued in WY07; nearby Ward Rd bridge site renumbered as 5.

WQ Parameters: Seven measured and recorded parameters (Temp, pH, SC, DO, DO%Sat, NO₃ & PO₄) plus subjective field observations re: environs and characteristics are listed in **Table E.3.** As nutrient testing for NO₃ and PO₄ is carried out at five selected sites; two in West (2 & 6) and three in East (11,14 & 15), respectively, results are not used in performing statistical analyses regarding reaches/sections of the river. Number of datum for each of the five physical-chemical parameters monitored monthly at each site over the 9-yr period (Oct. 04 - Oct. 13) are in the range of 80 to 95. Two other water quality parameters monitored by others at several sites, streamflow from USGS (Poway Office) and coliform counts from SDCoastKeeper, are also recorded for purposes of determining the water quality index.

⁽b) Monthly monitoring initiated in 2008; site also termed Jackson Dr. Outfall (OF).

⁽c) Monthly monitoring initiated in 2007 with adjusted site location in 2009.

LSDR - Lower San Diego River Watershed: SD Estuary to Lakeside (Sites 1-15 above) [MV2+MG+SB]	East (SB) - Santee Basin Section: We	est Hil	ls Parl	kway to Lakeside (Sites 11-15 above) [LSB+USB]						
	LSDR	- Lower San Diego River Wa	tershe	d: SD	Estuary to Lakeside (Sites 1-15 above) [MV2+MC	G+SB]					

Reaches (5) - averaged values for combination of adjacent sites excluding tributaries within identified portions of river (LMV, UMV, MG, LSB, USB).

Sections (3) - averaged values for adjacent reaches (MV = LMV+UMV, MG = MG, SB = LSB+USB)

Tributaries (3) – sites located on small creeks/drainages tributary to main stream watercourse.

LSDR – computed values for entire lower watershed (distance-weighted average of all 5 reaches or all 3 sections); average (LMV+UMV+MG+SB) or average (MV2+MG+SB).

Protocol: <u>East Side</u> – (Santee Basin & Mission Gorge Sections). The 8 sites within upper three reaches (MG, LSB & USB) typically monitored 3^{rd} Fri. or Sat. of month. <u>West Side</u> - (Mission Valley Section). Seven sites within the lower two reaches (LMV & UMV) monitored monthly, typically 3^{rd} Sun. of month.

Table E.3 - LSDR Water Quality Monitoring Parameters

WQ Parameter	unit	Comments			
Measured monthly at all sites:					
1. Temperature (Temp)	oC	Basic characteristic and WQ driver (Table C.1)			
2. pH	-	Degree of acidity (<7.0) or alkalinity (>7.0) (Table C.3)			
3. Specific Conductivity (SC)	mS/cm	Measure of ionic content or dissolved solids (Table C.2)			
4. Dissolved Oxygen (DO)	mg/L	Good indicator of relative water quality (Table C.4)			
5. Percent of DO Saturation (DO%Sat)	%	Good indicator of general water quality (Table C.5)			
Sampled/tested monthly at selected sites: (t	ypically 5 - 3 E	East & 2 West)			
6. Nitrate (NO ₃ -N)	mg/L	Important nutrient for biological activity			
7. Phosphate (PO ₄ -P)	mg/L	Key nutrient for biological activity			
Discontinued on regular basis in 2006:					
8. Turbidity	NTU	Discontinued due to inaccurate/invalid readings			
9. Barometric Pressure	mBars	Suspended readings as external data readily available			
Environmental Observations recorded a	at all sites:	<u>'</u>			
, ,	ansion of inva	odors, etc.), trash/debris, homeless encampments, biological asive species, erosion, scouring, other noteworthy comments re:			
General WQ Conditions observed at all site	es: (numerical d	coding added in 2010)			
Weather Condition, Presence of Algae,	Clarity, Color	, Odor, Flow, Foam, Litter, Odor, Oil and Grease (O&G)			
Parameters measured by others at selected s	sites				
10. Coliform counts MPN/ SDCoastKeeper data taken at Fashion Valley Rd and Old 100mL Mission Dam monitoring sites (Table H.2)					
11. Stream Flow	cfs	USGS gauging stations at Fashion Valley and Mast Rd near Santee (Table H.1)			

Team Leaders and multiple citizen volunteers (typically 3-8 persons) meet at an appointed site, organize field equipment/transportation, drive to sites, measure physical-chemical water quality using Sonde instrument, note special conditions/observations, collect samples for subsequent testing, return to office, perform nutrient ($NO_3 \& PO_4$) tests, store samples for subsequent laboratory (e.g., sediment toxicity) analyses and clean/check-in/store field equipment.

Data Management: Water quality data are typically managed in a three-step process.

- 1. *Raw* (source) data each site, several of which have two monitoring locations (e.g. upstream/downstream of dam, riffle or crossing), date/time, measured WQ parameters, and non-quantifiable supporting observations and comments.
- 2. *Compiled* (vetted/proofed) data provided on Ecolayers w/date, site location, parameter value and additional observations of interest.
- 3. *Processed* (formatted/aggregated) data with statistical computations associated with LSDR sites, reaches, sections and tributaries for each WQ parameter of interest including those monitored by others.

Statistical Computations: Various basic statistical values have been calculated from the data.

Mean – average of a series (sum of values divided by number of values)

Median – middle value of an ordered series (50% larger - 50% smaller)

Minimum – lowest or smallest value measured

Maximum – highest or greatest value measured

Range – Difference between maximum and minimum values

1st Quartile (Q1) – 25% of values smaller - 75% larger

2nd Quartile (Q2) – 50% of values larger - 50% smaller (same as median value)

3rd Quartile (Q3) – 75% of values smaller - 25% larger

Variance – sum of the squares of deviation from the mean or average value

Standard Deviation (SD) - square root of the variance

Skew – third moment about the mean divided by the standard deviation (SD)

Coefficient of Variance (CoV)– Variance divided by the mean

Trend line - Moving average value taken over 12 month period

Figure E.1 - Lower San Diego River Catchment and WQM Sites

Color Code for LSDR reaches on figure above: Estuary (orange), LMV (purple), UMV (red), MG (dark green), LSB (violet), USB (dark blue), Lakeside (light green), tributaries (light blue). Figure details can be downloaded through Google Earth from SDRPF website/River Monitoring page: file <Fig1.1WQMR.kmz>

Appendix F - LSDR Hydrology and Water Quality

Stream flow or discharge, the volume of water moving past a designated location over a fixed period of time, is a primary driver of changes in water quality. Flow, often expressed as cubic feet per second (cfs) or million gallons per day (mgd), constitutes the amount of water moving off a watershed into a watercourse, as affected by weather (increasing during rainstorms and decreasing during dry spells) and changing during different seasons. Flow decreases during summer months when rainfall is minimal, evaporation rates high and actively growing riparian vegetation extracts water from the ground. August and September are typically months of lowest flow. A function of both volume and velocity, stream flow has a major impact on living organisms, watercourse habitats and on overall water quality. Velocity of flow, typically increasing as volume increases, determines the kinds of organisms that live in the system and also affects the amount of silt and sediment thats transported. Fast moving watercourses usually contain higher levels of DO than slow streams, as they are better aerated.

LSDR average daily flow (ADF) values as recorded at the two USGS gauging stations in the lower watershed are expressed in **Table F.1** for both the monitoring period (Oct 2004 - Oct 2013) and the past 48 years (1965-2013) of official records. The two averages are in close accord for both stations.

Table 111 Zower of the reage Barry 110 to (W100 W110)										
Season	West - Mi	ssion Valley	East - San	tee Basin	LSD	R ^(a)				
Units (b)	cfs	mgd	cfs	mgd	cfs	mgd				
Fall (Oct/Nov)	20.7	13	13.1	8.5	17	11				
Winter (Dec-Mar)	83.6	54	45.9	30	65	42

Summer (June-Sept)	2.3	1.5	1.7	1.1	2.0	1.3				
9-Yr Annual Avg. (2005-2013)	35.2	23	20.1	13	27.6	18				
48-Yr Annual Avg. (1965-2013)	36.3	23.5	21.7	14	29.0	18.7				
Total Annual Discharge, AF (c) 25,760		26,320	14,560/1	15,680	20,165/20	,940				

Table F.1 - Lower SDR Average Daily Flows (WY05-WY13)

Correlations between total annual rainfall and ADF considered over the past 99 years of hydrologic record and during the period of SDRPF RiverWatch monitoring for the two lower SDR gauging stations are presented in **Tables F.2 and F.3**, respectively. WY05 was a "Very Wet" hydrologic year, whereas WY07 was "Very Dry". WY06 & 08 were both "Dry" years while WY09 & 10 were considered "Normal" in terms of both total annual rainfall and average daily flow. The 9-yr ADF in the East and West is 21 and 37 cfs, respectively; both values are approximately the same as the past 45- as well as 99-yr SDR average daily discharges.

Monthly discharge data (min, max and average daily flow) at the two gauging stations extending from Oct 2004 through Oct 2013 are presented in **Chart F.1.** Average daily flow (ADF) for the lower San Diego River varies from less than 1 cfs (0.6 mgd) during the summer (dry) months to nearly 200 cfs (130 mgd) during some winter (wet) seasons in the East (Santee Basin) and up to 380 cfs (246 mgd) in the West (Mission Valley) section. ADF values have been trending upward since WY07 as shown by the 12-month moving average.

⁽a) Lower San Diego River average daily flow represents a mean hydrologic condition based on averaging the two USGS gauging station stream flow values.

⁽b) ADF values are expressed in both cubic feet per second (cfs) and million gallons per day (mgd); 1 mgd = 1.547 cfs

⁽c) Annual discharge volume expressed in acre-feet (1 AF = 325,900 gallons); 9- and 48-Yr averages.

Table F.2 - Rainfall and Long-Term Average Daily Flow (1914-2013)

99-Yr Average ('14-13)	254	10.0	0%	18	28	23	11%

⁽a) Percent difference from long term average annual rainfall (254 mm/yr or 10.0 in/yr); black-above, red-below average.

Monthly and seasonal average annual flows and rainfall over the monitoring period for both stations are shown in **Chart F.2.** The seasonal flow patterns describe range, variance and correlation in monthly ADF and rainfall over the past 9 years. Winter season streamflow within the lower watershed is 100-to-250 times greater than summer, dry season flow. Average annual, winter and summer flows and rainfall for each of the water years are presented in **Chart F.3.** Highest flows during the monitoring period at both gauging stations were recorded in WY05 (very wet year); the lowest in WY07 (very dry year). Water years (WY06&08) witnessed below normal rainfall and runoff/streamflow. WY10 witnessed near normal

b) Santee Basin USGS Stream Gauge Station at Mast Rd.

c) USGS Stream Gauge Station at Fashion Valley Mall; incomplete data prior to 1965.

d) Percent difference from 30-Yr average annual daily flow (i.e., 21 mgd).

rainfall and river discharge. WY11 was an above normal year whereas WY12 and WY13 were both below normal in terms of total annual rainfall and average daily stream flow.

a) All values expressed as percent; WY13 values less than WY12 are expressed in red. b) Water Year 2013/2012 values are based on averaging of monthly (Oct- Sept) data.

b) Water Year 2013/2012 values are based on averaging of monthly values (Oct- Sept).

c) Tributary discharges within the Lower Santee Basin reach just upstream of Carlton Oaks Golf course.

Appendix H - WY13 LSDR WQM Data by Others

U.S. Geological Survey (USGS) stream flow values (mean daily discharge in cubic feet per second) presented in **Table H.1** for the two Lower San Diego River gauging stations are provisional data subject to revision. Processing and review of the 2012 data is typically completed in December with subsequent approval for publication. The two stations are managed by the Poway South Field Office. Data for the San Diego River gauging stations as well as other streams and rivers throughout California are available via URL at http://waterdata.usgs.gov/nwis/dv?.

a) Average daily flow during 3-day period of water quality monitoring.

Average daily flow in WY13 was down 30% (3.4 cfs) in the eastern portion of the LSDR and down 45% (8.5 cfs) in the western portion from WY12. LSDR total discharge during WY13 amounted to 5,864 AF vs 8,326 AF for WY12 and 26,000 AFY on average over the past 48 years of record. Average annual streamflow for WY13 amounted to less than 23 % of the 48-year mean flow for LSDR. The summer season (June-Sept) of WY13 represented one of the lowest periods of dry weather flow recorded at Fashion Valley since the mid 1980's.

b) Average daily flow for entire month.

c) WY13 values lower (less) than WY12 are expressed in red.

San Diego CoastKeeper (SDCK) coliform count values (in MPN/100 mL) from the organization's two San Diego River monitoring stations for WY13 and WY12 are presented in **Table H.2**. Monitoring results from 2009 through 2011 for selected San Diego area watersheds, including the lower San Diego River (HSU 907.1), can be accessed via the organization's URL website at: http://www.sdwatersheds.org/wiki/Main-Page.

a) Escherichia-coli (E.coli) bacteria expressed in MPN/100mL

b) Enterococcus (faecalis) bacteria expressed in MPN/100mL

c) Total Coliform bacteria (common) expressed in MPN/100mL.

d) Mean coliform counts for WY13/WY12 calculated by SDRPF RiverWatch for comparative purposes only; values are neither endorsed nor validated by the San Diego CoastKeeper organization.

e) WY13 values lower (less) than WY12 are expressed in red.

Mean coliform counts vary can vary considerably from month to month however there is little evidence of an established pattern from season to season, from east to west or from year to year. Highest TCB's are typically monitored following storm flow (wet weather) events such as in Jan. of this year.

Appendix I - Water Quality Indexing

Decision-makers, non-technical water managers, numerous vested watershed stakeholders as well as the general public usually have neither time nor training to study and understand detailed technical assessments of water quality data. Over the last several decades numerous indexes have been developed to summarize water quality data in an easily expressed and readily understood format. Water quality professionals are often resistant to any automated, uncritical summarization represented by such indexes; there are sound reasons to use results with caution. Often scientists and water resource professionals prefer to provide no answer rather than an imperfect answer that can lead to misunderstanding. Layman and many decision makers, however, prefer an imperfect answer to no answer at all. Using an index may not be the optimal way to fully understand large-scale water quality issues, but it does provide a reasonable tool for gaining insight. Professionals can appreciate the need for imperfect answers and conversely others need to recognize and accept an answer's limitations.

Water quality indexing was first proposed and demonstrated in the 1970s, however, prior to the personal computer, calculations were fairly labor-intensive so the technique was not widely used or accepted by many monitoring agencies. As use and limitations were commonly misunderstood, the potential of using an index for communicating water quality status and trends was often overlooked. Evaluation of water quality in terms of raw data can be very misleading and confusing not only for the layman but also to stakeholders with diverse and sometimes conflicting perspectives. It is typically difficult for individuals interested in water quality to interpret reams of raw data in order to gain an understanding of water quality conditions. This quest often results in faulty conclusions regarding water quality status and watershed management practices. An index is simply an attempt to integrate complex analytical data and generate a single number expressing the relative degree of impairment of a water body at a given point in time or given locale. The underlying objective of the exercise is to enhance communications with the general public, interested stakeholders, public agencies and increase citizen awareness of water quality conditions.

By design indexes contain less information than the raw data they summarize; many uses of water quality data cannot be met with an index. An index is generally most useful for comparative purposes (e.g., what river sites or reaches have particularly poor water quality?) and for temporal questions (e.g., how is the water quality at present relative to what is has been in the past?). Indexes are less suited to specific questions. Site-specific decisions need to be based on analysis of original water quality data. Basically, an index can be a useful tool for "communicating water quality information to the lay public and to legislative decision makers," it is not, however "a complex predictive model for technical and scientific application". This index was developed as a mechanism to summarize and report routine monitoring data to interested parties. SDRPF's RiverWatch team does not monitor biological constituents or toxic substances, thus issues related to public health, body contact recreation and aquatic life are not effectively addressed by the index.

Besides being general in nature (i.e., imprecise), there are several reasons that an index may fail to accurately communicate water quality information. First, most indexes are based on pre-identified sets of water quality constituents. For example, a specific site may show a good WQI score, and yet have water quality impaired by other constituents not included in the index. Another reason, data aggregation can mask, normalize or over-emphasize short-term water quality issues. A satisfactory WQI at a particular site or reach does not necessarily mean that water quality is or always was satisfactory. A good score, however, does at least indicate that inferior water quality for those constituents evaluated is not chronic during the period included for the index.

The index has been developed for the purpose of providing a simple and concise expression of regularly monitored physical-chemical and bacteriological water quality data compiled by the SDRPF RiverWatch Team as well as several other monitoring groups; it is intended to aid in assessment of the Lower San Diego River watershed primarily for non-body contact recreational uses and environmental enhancement. It constitutes a mechanism to compare averages, variances and trends in normalized values over time (temporally) and by relative location (spatially) within the watershed. The index allows anyone to easily interpret large amounts of aggregated data and relate overall water quality variation to changes, be they from natural causes or man-made impairments. The WQI is used to identify general water quality trends over the past 8 years of monitoring and potential problem areas within the SDR watershed. Such patterns and locations can then be screened and evaluated in greater detail through direct observation of pertinent site-specific data by public agencies and water quality professionals entrusted with protection and enhancement. Used in this manner, the index provides a supplemental metric for evaluating effectiveness of the many San Diego River water quality improvement programs and also assist responsible agencies and organizations in establishing priorities for watershed management.

Running average LSDR WQI values from WY05 through WY12 are expressed by river reach and river section on Charts I.1 and I.2, respectively. Chart I.1 also presents overall LSDR monthly WQI values over the 8-year period. Both seasonal patterns and trends in WQI values can be seen. Chart I.2 provides the range (max-min) in monthly WQI values as well as average monthly streamflow. The water quality fluctuations over time in individual reaches, sections and the overall (average) Lower San Diego River expressed on both a running average basis and the annual cycle can be observed. The Upper Santee Basin reach (Sites 13 & 14) presents lowest index values since March of 2010, whereas the Mission Gorge (middle section) reach consistently presents highest values. There has been a general decline in overall water quality, as evidenced by the WQI values, since November of 2011. The running (12-mo) average index value fell by 9 units (22.5%) from high of 40 (13% above the 9-yr mean) over the last 22 months to a current (Sept '13) low of 31 (-13% below the 9-yr mean).

Chart I.3 presents a temporal summary of variances in the water quality index values profiled on a monthly, seasonal and average annual water year basis for each river reach and the overall LSDR average. These variances are compared to changes in streamflow on the same basis. The positive correlations are evident, i.e., increase in average daily flow results in improved water quality. Low flow throughout the summer period results in poorest water quality.

Chart I.4 provides a spatial profile of average annual WQI by river monitoring site, reach and section for this year (WY13), last (WY12) and the 9-Yr winter, summer and annual averages. The sites are in chronological order ascending upstream. The current (WY13) average annual WQI values shown in black are below those from last year (WY12) shown in red at all monitoring sites. The WQI values for WY13 are also below the 9-Yr averages (yellow bars) at all but two (7&12T) monitoring sites. For the third consecutive year, Site 13 (Mast Park) has demonstrated lowest water quality values.
